BAR COHEN

BACKEND ENGINEER
+972-54-355-2466 | barcohendev@gmail.com | LinkedIn | GitHub

SUMMARY

Challenge, Innovation, Excellence.
I'm Bar Cohen, a **Backend Engineer** experienced with **Node.js, PostgreSQL, Claude Code, RAG,** and **AI Agents,** and I have a proven track record of building AI backend infrastructure that reduces patient recovery time. I'm ready for my next challenge in a company building scalable products, reliable cloud infrastructure, and clean, maintainable code.

EXPERIENCE

2025 - Present: Full-Stack Engineer, Pulse

I built an **AI-driven recovery platform** end-to-end with **React, TypeScript, Node.js, and PostgreSQL,** designing daily progress tracking, goal setting, and a community forum with an **AI assistant** that delivers personalized insights and motivation. I integrated **Google AI** for conversational support, containerized the system with **Docker,** and deployed the MVP to **AWS**. I engineered a fleet of pre-commit **AI review agents** for code review, style enforcement, architecture auditing, duplication removal, and security scanning to keep the codebase consistent and secure.

- Cut page load time by over **90%,** from **8-12 seconds to under 0.5 seconds,** by migrating to a **Next.js** client and fixing a memory-leak build bug.
- Saved ~**50K tokens per run** (**35-40% of context**) by replacing heavy integrations with lightweight API scripts, restoring full development velocity.

2024 - 2025: Full-Stack Engineer, WorkonIt.ai

I developed an **AI-based recruitment platform** as a freelancer, building an **OpenAI**-powered assistant that filters relevant jobs, rewrites resumes, and drafts job posts, plus a campaign scheduler that publishes across Facebook, WhatsApp, and Telegram groups. I re-architected a monolith into separate **client and server deployments** on **Vercel and DigitalOcean,** added **object storage** for resumes and media, integrated **OTP authentication** and **SendGrid email** service.

- Delivered a production **beta** end-to-end, shipping job posting, applications, AI campaign scheduling, and paid subscriptions.
- Reduced **1,500-line** files into modular components of **50-200 lines** each by applying **SOLID** principles, improving maintainability.

EDUCATION

2023 - 2024: Practical Software Engineering, Ariel University College of Engineering

Bridged theory and practice by building **TechTreasure,** a full **e-commerce platform** for technology products with **React, TypeScript, Node.js, Express, and MongoDB**, integrating **Stripe** payments end-to-end. Specialized in **data structures, algorithms, advanced full-stack development, AWS, and cloud architecture.**

2021 - 2022: Full-Stack Software Development, ORT Singalovski College

Bridged theory and practice by building **BE-FIT,** a full-stack fitness platform with **Node.js, Express, and MongoDB,** integrating **JWT authentication, Google OAuth, PayPal, and email services** with a dedicated admin dashboard. Specialized in **algorithms, C, Java, JavaScript, and RESTful API design.**
